

MOCK DRILL - ADMIN SUPERVISOR

Retailer WhatsApp order to collection - live test checklist

Goal

Run one safe end-to-end test: retailer order -> Sales approval -> Warehouse packing -> DCO handover -> Delivery proof -> Collection and settlement.

Before the drill

1. Team tab: confirm Sales, Warehouse, and every Delivery + Collection agent has the correct WhatsApp number, role, and Wholesale Warehouse scope.
2. Retailers tab: Mock drill readiness must show Ready. Use Prepare mock drill only when test products or test retailer shells are missing.
3. Use one registered test retailer number only. Confirm its salesperson, B2C billing, warehouse, and collection privileges before starting.
4. Keep one clear weighing-scale photo, one delivery handover photo, and one UPI/cheque proof photo available for the test.
5. Do not mix a live customer, live bill, or real cash with this drill.

Admin control rule

Do not clear test activity until every failure has a screenshot, WhatsApp command, time, and staff name recorded.

Run the drill

1. Retailer: send guide, order a WA TEST product at MOQ, add another item if needed, Finalize, review proforma, and Confirm Order.
2. Sales: open Orders, verify retailer, rate, MOQ, B2C bill type, and Wholesale Warehouse. Confirm the SO.
3. Warehouse WhatsApp: type SO, select the order, send scale photo. Local OCR reads if clear; otherwise type the actual kg. Resolve mismatch with Change or press Packed.
4. Warehouse WhatsApp: type DCO, add one or more packed SOs, select the Delivery + Collection agent, then type HANDOVER with the DCO last digits after physical handover.
5. Delivery WhatsApp: type LIST, select DCO and retailer, verify address/contact/amount, press Done, and send delivery handover photo.
6. Collection: follow only the buttons shown by privilege. Test Cash denominations and one UPI proof. Local OCR reading must be checked before Confirm; unreadable proof uses manual amount entry.
7. Admin: watch Collection approval alerts. For a planned mismatch, verify it reaches the alert queue. Then use SUM, LIST COLLECTION, and SETTLE for the delivery agent.

Pass/fail checkpoints

1. PASS: Every WhatsApp step reaches the correct next person and every proof is attached to the correct SO/DCO/retailer.
2. PASS: Collection privilege buttons change only when the retailer tag permits them.
3. PASS: OCR never auto-settles a payment. A visible confirmation or manual amount is required.
4. FAIL: Wrong person sees a DCO, rate/MOQ changes unexpectedly, proof is missing, or total differs without an Admin alert. Record it and stop that branch.

Close the drill

After admin records the result, Retailers -> Clear test chats & orders. Keep the test products and test retailer shells for the next rehearsal.
